workshop

Build your own Gateway with RAK831 and RESIN.IO

Workshops start at:

- 10:45
- 13:30
- 15:30

**THE THINGS
CONFERENCE**

Workshop

Build your own Gateway with RAK831 and RESIN.IO

Your trainers:

Jac Kersing

Leonel Lopes Parente

Charles-Henri Hallard

Gergely Imreh (resin.io)

Shaun Mulligan (resin.io)

01-02-2018

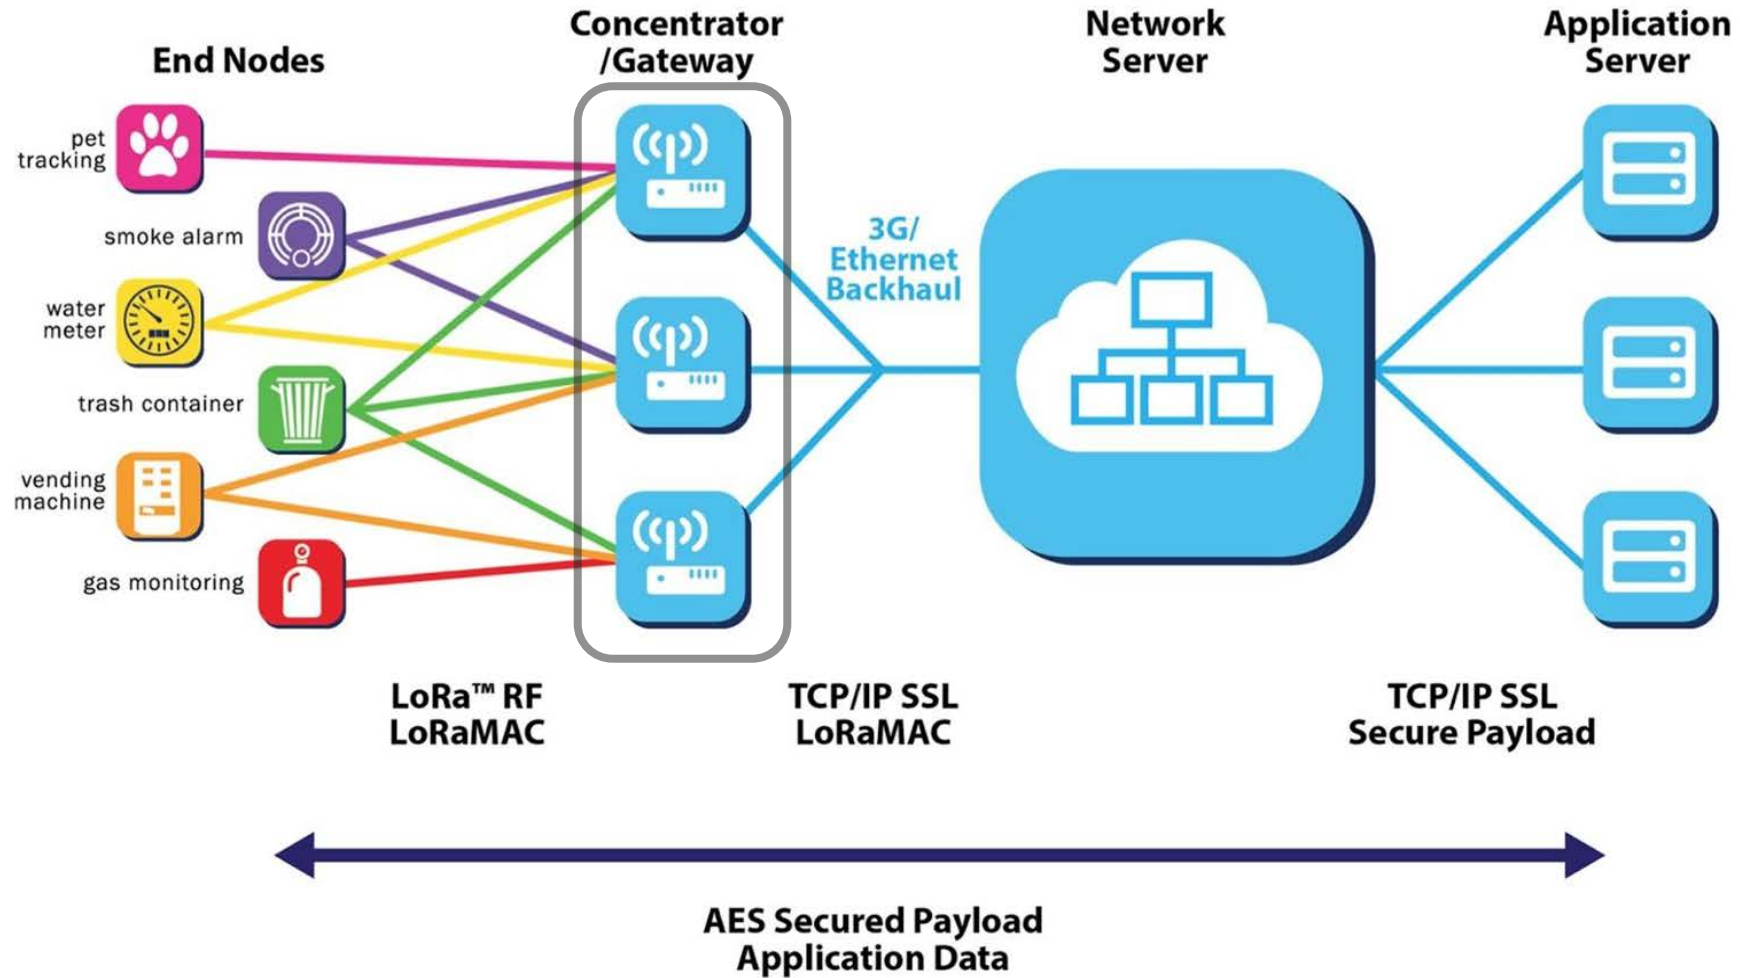

Agenda

- Brief LoRaWAN Gateways overview
- RESIN.IO introduction
- **The real thing - Setup your own RAK831 gateway *(self-paced)***
- Demo of advanced RESIN.IO features

LoRaWAN Gateways overview

LoRaWAN Gateways

Gateway function

- Gateways receive LoRa modulated data packets conforming to the LoRaWAN specification
- Add metadata (frequency, spreading factor, SNR, RSSI, (wall) time received, timestamp)
- Forward to back-end
- Receive packets with metadata (frequency, spreading factor, timestamp and of course data)
- Forward to radio at the appropriate time for transmission (JIT)

Gateway hardware

- Gateways cover at least 8 channels.
- Most gateways are based on embedded Linux system, the Things Network Gateway being a notable exception.
- All gateways require a decent antenna and proper antenna placement!
- Don't expect 15 km range from an indoor gateway with 1/2 wave whip antenna in a city

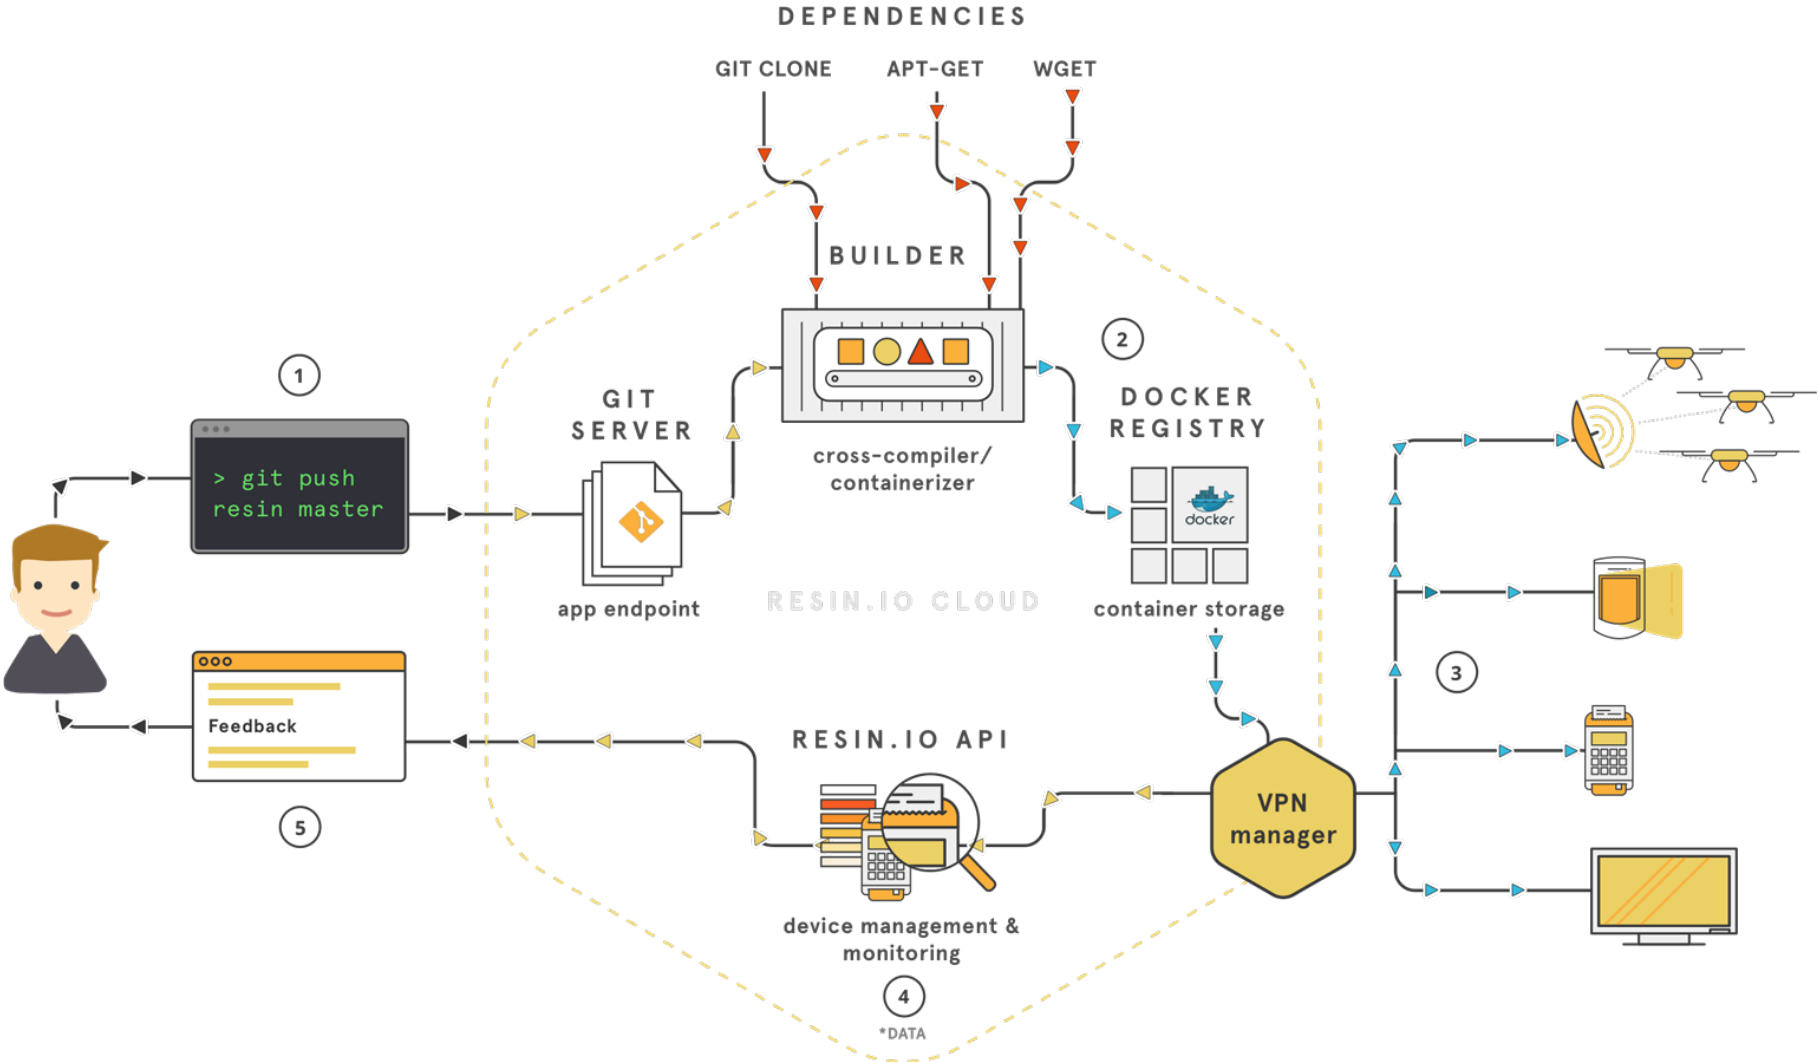

Gateway software

- Gateway requires a 'packet forwarder' that receives the data and forwards it (from radio to network and v.v.)
- Some forwarders allow connection to multiple backends, take care when using as this might result in airtime restriction violations!
- Packet forwarders are dumb:
 - they do **not** filter packets in any way (a gateway does not know which packets are valid within the network)
 - they can not decrypt the data (keys are not known)

resin.io introduction

resin.io components

Need help

git push resin master

Setup your own RAK831 gateway

Workshop Steps (*self-paced*)

- Install required tools / create accounts
- Flash resin.io image to SD card
- Get prebuild software template
- Push template to resin.io to have it build the software
- Wait for gateway to get the software and 'activate'

Workshop URL

<https://github.com/kersing/gateway-workshop>

References for gateway software

For Linux based systems there are a couple of options:

- Semtech reference implementation
https://github.com/Lora-net/lora_gateway
- TTN packet forwarder (*development frozen*)
https://github.com/Lora-net/lora_gateway
- Poly Packet forwarder
https://github.com/devlaam/packet_forwarder
- Multi Protocol Packet forwarder
https://github.com/kersing/packet_forwarder

Questions?

Thanks for participating in the workshop.
Have a great conference!
